TITLE: The "gross structure" of the proton spectra in stripping reactions

PERIODICAL: Zhurnal eksperimental'noy i teoreticheskoy fiziki, v. 42,  
no. 6, 1962, 1481 - 1487

TEXT: In order to study the "gross structure" of the proton energy spectra, the (d,p) stripping reactions on Fe<sup>56</sup>, Cu<sup>63,65</sup>, Zn, Se, Zr, Nb<sup>93</sup>, Ag<sup>107,109</sup>, Cd<sup>111,116</sup>, Sn<sup>116-120,124</sup>, Pt, Au<sup>196</sup>, Pb<sup>208</sup>, and Bi<sup>209</sup> nuclei were investigated. Measurements were made with an external 13.6 Mev deuteron beam of the cyclotron of the Institut fiziki AN USSR (Institute of Physics AS UkrSSR). The targets were unbaked films of between 2 and 6 mg/cm<sup>2</sup> thickness. The differential cross section of the stripping reaction as function of the energy liberated exhibits maxima. There is a clear relationship between the positions of the maxima of this gross structure and the strongly excited levels of the nuclei. Many levels correspond to each

Card 1/2

The "gross structure"...

maximum of the gross structure. As the nuclear shells progressively become filled the energy liberated in the transition of the residual nucleus to the ground state decreases. The maxima of the neutron spectra are coordinated with an excitation of the single-particle states of the nuclei. There are 3 figures and 1 table.

TITLE: Inelastic scattering of deuterons by some chromium, zinc and tin isotopes  
Report of the Thirteenth Annual Conference on Nuclear Spectroscopy, held in  
Kiev from 25 January to 2 February 1963

SOURCE: AN SSSR, Izv. Seriya fizicheskaya, v.27, no.7, 1963, 927-931

TOPIC TAGS: deuteron scattering, inelastic scattering, Cr, Zn, Sn, chromium, zinc, tin

ABSTRACT: The singularities of deuterons (low binding energy, asymmetry and large radius) largely determine the particular mechanism of inelastic scattering of these particles and make it different from the scattering mechanism typical of other particles. Despite the fact that there have been numerous studies of inelastic deuteron scattering since 1949, the nature of the mechanism involved is still obscure, and, owing to the lack of an adequate theory and full data, the results of deuteron scattering experiments cannot be utilized for the purposes of nuclear spectroscopy. Hence for the purpose of obtaining additional information on inelastic scattering of deuterons the authors carried out measurements of the differential inelastic scattering cross sections for 13.6 MeV deuterons by Cr<sup>50</sup> (0.79 MeV),

Card 1/2

$\text{Cr}^{52}$  (1.42 MeV),  $\text{Zn}^{64}$  (0.98 MeV),  $\text{Zn}^{68}$  (1.02 MeV),  $\text{Zn}^{70}$  (1.0 MeV) and  $\text{Sn}^{116}$  (1.2 and 2.3 MeV). The scattered deuterons were detected by means of a scintillation spectrometer, using the "dE/dx and E method". The observed angular distributions are presented in the form of curves. It is difficult to identify a predominant reaction mechanism on the basis of the results for inelastic scattering. It would appear that the conclusion of M.El-Nadi and M.Wafik (Proc.Phys.Soc., 76, 185,1960) that the predominant inelastic scattering mechanism in stripping is valid only for light nuclei in the range of medium angles. "The authors are grateful to A.P.Klyuchev for providing the isotopic targets, L.I.Slyusarenko for assistance in the work and the personnel of the Cyclotron Laboratory for insuring faultless operation of the accelerator." TITLE: Elastic scattering of deuterons by chromium and zinc isotopes

SOURCE: Zhurnal eksper. i teor. fiziki, v. 44, no. 6, 1963, 1765-1769

TOPIC TAGS: elastic deuteron scattering, chromium isotope, zinc isotope, angular distribution, optical model, compound nucleus model

ABSTRACT: The angular distributions of 13.6-MeV deuterons elastically scattered by Cr<sup>50, 52, 53, 54</sup> and Zn<sup>64, 68, 70</sup> isotopes are measured at angles from 2.5 to 150° with the aim of studying isotopic effects for elastic scattering of deuterons, similar to studies already made for protons. The curves obtained for the ratio of the experimentally measured cross sections to the cross sections for Coulomb scattering have a diffraction nature. As the number of neutrons increases, the maxima shift toward the smaller angles and the cross section begins to decrease at a higher rate with increasing angle. Comparison is made with data obtained by others. "In conclusion, the authors take this opportunity to express their gratitude to V. N. Medyanik, L. G. Lishenko, and A. D. Nikolaychuk for preparing the isotope targets, and to the

Card 1/2/ cyclotron crew for uninterrupted operation of the apparatus.

TITLE: The spins and parities of some states of molybdenum isotopes

PERIODICAL: Zhurnal eksperimental'noy i teoreticheskoy fiziki, v. 44,  
no. 1, 1963, 17 - 21

TEXT: The angular distributions of protons emerging from (d,p) reactions on targets enriched in Mo<sup>92</sup>, 94, 95, 96 were measured by means of an ionization chamber with a deuteron absorber at its input. The deuterons releasing the reaction had an energy of 13.6 Mev. The angular momenta for neutron capture in the ground, and first excited, states were obtained from the experimental data with the aid of Butler's theory (Proc. Roy. Soc., A208, 559, 1951). The possible spins and parities of these states of the Mo isotopes are considered in this way. Results: Mo<sup>92</sup> - (1) 3/2<sup>+</sup> or 5/2<sup>+</sup>, (2) 1/2<sup>+</sup>; Mo<sup>93</sup> - (1) 5/2<sup>+</sup>, (2) 1/2<sup>+</sup>; Mo<sup>95</sup> - (1) 3/2<sup>+</sup> or 5/2<sup>+</sup>, (2) 1/2<sup>+</sup>; Mo<sup>96</sup> - (1) from 0<sup>+</sup> to 5<sup>+</sup>, (2) probably 5/2<sup>+</sup>; Mo<sup>97</sup> - (1) 5/2<sup>+</sup>.

**ABSTRACT:** The energy and angular distribution of  $\alpha$ -particles from the  $\alpha\beta\gamma$  decay of  $Mg^{25}$  was measured at 100 MeV/nucleon. The angular distributions were found to be consistent with the three-body exchange model of nuclear scattering. The energy distributions were found to be consistent with the theory of statistical nuclear dynamics.

angular distributions. In the ( $d,p$ ) reaction; principally single-particle neutron

states appear to be excited.

Angular distributions of the reaction  $d(p, n)$  have been measured at all energy levels up to 100 MeV. At low energies the angular distributions are found to be in agreement with theory. At higher energies the distributions deviate from theory. This deviation is attributed to the presence of multiple-particle states.

TITLE: Role of the "orthophenol-orthoquinone" system in the  
primary mechanisms of radiation effect on the organism

SOURCE: AN SSSR. Izvestiya. Seriya biologicheskaya, no. 4, 1965,  
507-520

TOPIC TAGS: radiation biologic effect, phenol, quinone, enzyme,  
desoxyribonucleic acid, tyrosine, oxidation

ABSTRACT: A hypothesis stating that the oxidation reaction of  
orthophenols in response to high energy irradiation is closely  
related to the formation of orthoquinones (semiquinones) has evolved  
from the experimental work of the laboratory with which the authors  
are associated. In the present study the immediate effects of  
X-irradiation on enzyme process rates were investigated in a  
tyrosine+tyrosinase model system under strictly controlled conditions

(210 kv, 15 ma, no filter, 100 to 1000 r doses, 10 min incubation). Change in enzyme process rate was determined by the concentration of newly formed orthophenols and orthoquinones. With irradiation of the whole system, the concentration was 5 times higher than for controls. Irradiation of only the tyrosine solution led to a lesser concentration, and the concentration decreased still further with irradiation of only the tyrosinase. When the irradiated mixture was incubated with a suspension of mouse thymus nuclei, the tyrosine oxidation products (orthoquinones) were completely absorbed by the nuclei. Fluorescence tests with acridine-orange on thymus nuclei of mice immediately after irradiation and tests on thymus nuclei treated with tyrosine oxidation products demonstrated the similarity of irradiation effect and orthoquinone effect. The same effect was demonstrated with quinone extracts from gamma-irradiated plant tissue (potato). Treatment of carbon-labeled plant sprouts with extracts from irradiated plants depressed DNA synthesis by 50 to 60%, the same as after gamma-irradiation. Injection of purified orthoquinones, extracted from irradiated plant tissues, into young mice caused loss of weight, growth inhibition, and a sharp decrease in leukocyte level of the peripheral blood. These study data demonstrate the importance of the

TITLE: The effect of fast neutrons on DNA synthesis in seedlings

SOURCE: Radiobiologiya, v. 6, no. 1, 1966, 3-8

TOPIC TAGS: neutron irradiation, irradiation damage, gamma irradiation, cytoplasm, plant injury

ABSTRACT: Dry pea seeds of the Pobeditel' variety were irradiated with fast neutrons at 1, 3, and 10 krad, and the absorption of C<sup>14</sup> in 4-7 day old seedlings grown from the irradiated seeds was studied. An IRT-100 reactor with a mixed beam comprising 30+ % gamma rays was used for the irradiation. In seeds irradiated with fast neutrons at 1-10 krad, C<sup>14</sup> was found in 4-7 day old seedlings. Under neutron irradiation, the rate of DNA synthesis dropped 90% (compared with the control samples). Gamma irradiation of the seeds at the same dosage lowered DNA synthesis in

UDC: 539.125.5 : 58.039.1

Card 1/2

L 20693-66  
ACC NR: AP6007761

the seedlings by 30%. Unlike gamma irradiation, neutron irradiation lowered high polymer DNA yield by 50%—60%. It is concluded that under gamma irradiation, the destruction of DNA is largely due to the damage to cytoplasm metabolism, while under neutron irradiation, the cells are damaged owing to the disruption of the adenine structure in DNA. The DNA synthesis rate as a function of dosage and kind of irradiation is graphed. Orig. art. has: 4 figures and 2 tables. [14]

TITLE: Device for determination of moisture in gases. Class 42, No. 175681

SOURCE: Byulleten' izobreteniy i tovarnykh znakov, no. 20, 1965, 74-75

AM

TOPIC TAGS: moisture content, moisture determination, moisture measurement, moisture

ABSTRACT: This Author Certificate presents a device for determination of moisture in gases. The apparatus consists of a pipe with a mandrel, flow meter, d-c current supply, and a current meter (automatic or pointer type). On the mandrel are wound two platinum electrodes. The mandrel and electrodes are covered with a thin hygroscopic film, consisting of a partially hydrated coating of phosphorus anhydride. To obtain a uniform hygroscopic film, the mandrel is made from molybdenum glass and has bifilar spiral grooves on its surface for the electrodes. To increase the analytical response, the distance between neighboring electrode windings is maintained constant throughout the length of the mandrel. To increase the absorption of moisture by the hygroscopic film, a wire is wound on the mandrel in the direction opposite to the electrodes (see Fig. 1). The wire has an organic insulation and has a diameter equal to the space between the pipes and the mandrel. To signal excess moisture content in gases, the device has built into it a d-c triode amplifier and

regulator; 9 - manometer.

sound generator and a relay connected to the sound generator. To avoid errors of measurement (arising from fluctuations in the gas supply) exceeding the limiting values compensated for by the flow regulator, the entrance and exit of the flow regulator are connected to a differential mercury manometer equipped with contacts which close the circuit of the sound generator. Biosynthesis of nicotine labeled with carbon<sup>14</sup> and the processes of transmethylation in tobacco leaves. A. M. Kuzin and V. I. Mironova. *Doklady Akad. Nauk S.S.R.* 85, 383-5(1952). -- TOBACCO leaves (on the plant) were kept in the dark 2 days, cut, placed in a vessel with CO<sub>2</sub> labeled with C<sup>14</sup>, and subjected to illumination for 24 hrs. with elec. bulb; inactivation with hot water, mixing with ordinary tobacco leaves, mech. mincing of the mixt., and steam distn. from 2% NaOH gave the alkaloidal distillate, which was pptd. with silicotungstic acid; the ppt. showed radioactivity (80 counts/min./mg.). Steam distn. again after decompn. with NaOH and sepn. of nicotine as picrate gave material with 31 impulses/min./mg., indicating introduction of C<sup>14</sup> into the alkaloid. If the leaves after irradiation are kept in the dark 8 hrs. the activity of isolated nicotine rises to over 100. Oxidation of the product with SeO<sub>2</sub> showed that the C<sup>14</sup> is located in the N-Me group of the pyridine of nicotine. Leaves of *Nicotiana* thus carry on transmethylation with participation of nicotine.

Direct assimilation of carbon from organic fertilizers by a plant. V. I. Merenova and A. M. Kuzin. *Doklady Akad. Nauk S.S.R.* 94, 573-6(1954); cf. *ibid.* 90, 677(1953).— Radioactively labeled org. compounds of water-sol. and -insol. types were administered from culture soil to wheat and tobacco plants and the plant sprouts were subjected to radio-autophotography in the conventional manner. Thus tobacco plants readily assimilate C from water-sol. sugars, amino acids, and org. acids (AcOH, glycine). The plants show relatively slow assimilation of C from water-insol. materials. Generally the assimilation proceeds at the expense of CO<sub>2</sub> liberated by bacterial action of the soil from its org. content as well as by direct utilization of the org. matter by the plant.

Molecular Structure of DNA and Radiation Damage in Cells

N. B. Strazhevskaya and V. A. Serezhkov

In previous investigations the authors demonstrated in various cell types (erythrocytes and bone marrow of chickens, *E. coli*, Ehrlich ascites cells) the high radiation-sensitivity of the macromolecular DNA structures. In this investigation the authors studied the dynamics of the state of macromolecular DNA structures as a function of dose (50, 200, 500, 1000 and 5000 r) and of the time after  $\gamma$ -irradiation of rats (0.25, 1, 2, 4, 6, 8, 24 and 48 hr) in organs with different radiation sensitivity (thymus and liver). It was found that a distinct disturbance in the physio-chemical state of the macromolecular DNA structure in the thymus and liver is observed immediately after  $\gamma$ -irradiation of rats. The magnitude of the effect depends on dose. In the thymus this relationship is of an exponential nature for doses below 1000 r. The further fate of the macromolecular structure of DNA after irradiation is different for the radiosensitive and radioresistant tissues. In the thymus the changes of the macromolecular structure of DNA are irreversible, whereas in the liver this process is reversible. However, in the regenerating liver the disturbance of these structures following irradiation becomes irreversible, as in the case of thymus.

It is suggested that the radiosensitivity of the cell is determined by the special state of the macromolecular DNA structure (thymus) and by the presence of some mechanisms which are able to restore these structures (liver).

*Institute of Biological Physics of the Academy of Sciences of the USSR, Moscow*

The Initial Stages of Radiation Injury to DNA Structure

*V. I. Tokarskaya*

Our results confirm the assumption of a point injury in the structure of DNA molecules during irradiation, the point of injury being thymine. Observations on dry seeds and on isolated DNA showed that the injuries to the structures are of a potential nature and develop in the presence of water. The effects of neutron or  $\gamma$ -irradiation on the DNA structure of seeds were different.

Using  $^{14}\text{C}$  labelling it was shown that the changes in the template result in faulty synthesis and the DNA synthesized after irradiation has a qualitatively different composition.

To explain the remote effects of radiation on DNA it is suggested that loops are formed in the structure of irradiated DNA due to the loss of thymine.

TITLE: The biological effect of C<sup>14</sup> incorporated into living tissues

SOURCE: Radiatsionnaya genetika; sbornik rabot. Otd. biol. nauk AN SSSR. Moscow, Izd-vo AN SSSR, 1962, 267-273

TEXT: After the performance of nuclear tests the content of radioactive carbon in the atmosphere increased between 1955 and 1958 at 5% annually. When assessing the possible biological effects of these doses they are usually estimated by the radiosensitivity of living tissues exposed to the external source of radiation. These calculations fail, however, to take into consideration the special geometry of incorporation of C<sup>14</sup> into radiosensitive structures such as chromosomes as well as the so-called transformation effect in DNA molecules (C<sup>14</sup> → N<sup>14</sup>). These effects may lead to more frequent aberrations.

Card 1/3

The biological effect ...

S/747/62/000/000/016/025

tions than expected from calculations on the basis of the dose to which the cells are exposed. The authors compared the biological effect of C<sup>14</sup> incorporated into plant seedlings, with the effect of exposure to external gamma radiation emitted by Co<sup>60</sup>. Normally growing 10-day old plants were placed into a photosynthesis chamber containing C<sup>14</sup>O<sub>2</sub> (total activity 100 μC, volume of chamber 22.5 dm<sup>3</sup>); radioactivity of the inner layer of the plants was estimated on scintillation counters and the tissues were investigated cytologically, counting the proportion of micronuclei and the mitotic index. The percentage of cells with chromosome aberrations increased from 0.16% in the control plants to 0.26% in the experimental plants. Plant cells exposed to more than double the dose of radiation (Co<sup>60</sup>) showed a slight increase in the number of aberrations but calculation revealed that the mutagenic effect of incorporated C<sup>14</sup> was ten times higher than that of an equal dose of external irradiation.

This fact shows that the transformation effect C<sup>14</sup> → N<sup>14</sup> as well as

Card 2/3

The biological effect ...

S/747/62/000/000/016/025

the special geometry or the incorporation of C<sup>14</sup> are factors to be considered further. There is 1 figure and 1 table.

TITLE: Function of the orthophenol-orthoquinone system in the early mechanism of action of ionizing radiation on the organism

SOURCE: AN SSSR. Izvestiya. Seriya biologicheskaya, no. 4, 1965, 507-520

TOPIC TAGS: ionizing radiation, radiation biologic effect, radiation plant effect, tyrosine, sorption, oxidation, DNA, biosynthesis, radiation sickness

ABSTRACT: The authors concluded from a variety of experiments on plants and animals that the initial processes in the irradiated organism develop in the following sequence:

(1) During irradiation the formation of active radicals causes very slight radiochemical oxidation of the phenols present in the cell, chiefly tyrosine.

(2) The resultant oxidation products activate tyrosinase, which immediately after irradiation leads to the formation of large quantities of biologically active orthoquinones.

(3) The resultant orthoquinones are actively sorbed by the cell nuclei.

Z

L 25811-66

ACC NR: AP6015925

(4) The orthoquinones sorbed by the nuclei inhibit DNA synthesis, block the incorporation of thymidine into newly synthesized DNA, and alter their fluorescence in the presence of acridine orange.

(5) The blocking of nuclear DNA by the orthoquinones sharply inhibits cell division, giving rise to leukopenia, arrested growth, weight loss, chromosomal aberrations, and, in sufficiently high concentrations, death of the organism. Orig. art. has: 10 figures and 4 tables. [JPRS]

3. Surface surveys of (geological) structures. A. Tidmarsh  
("Geol. Mag."), 1853, 9, 191-7. - The geologist has at his disposal the information revealed by local digging and manual drilling, but in the Carpathians it is important to choose the locality for such operations so as not to waste expense, when information can often be gained from keen surface observations. The Carpathians are built up of long unbroken undulating anticlines, and often eroded formation farther along will reveal the required information. When shallow drilling is decided upon, the choice of locality should be made from the point of view of the actual information required, and not according to a pre-arranged method. The author's own experience in the analysis of the "Bednarka loop" on the borders of Jaslo and Gorlice areas showed that the formations exposed by a stream in its valley are quite enough to identify the whole structure. This great saving can be achieved in the search for oil in that region.

of the feldspars, the plagioclase is a mixture of Anorthite and Albite, the K-feldspar is a mixture of Orthoclase and Sanidine, and the mica is a mixture of Muscovite and Biotite. The quartz is a mixture of two forms, one being a tridymite-like form and the other a cristobalite-like form. The feldspars contain about 10% of tetrahedral substitutions by Al, far less than in the peridotites, but 10% more in the tridymite-like form than in the cristobalite-like form. The mica contains about 10% of tetrahedral substitutions by Al, far less than in the peridotites, but 10% more in the tridymite-like form than in the cristobalite-like form. The quartz contains about 10% of tetrahedral substitutions by Al, far less than in the peridotites, but 10% more in the tridymite-like form than in the cristobalite-like form.
